control thermostats

altecnıc

## Application

Altecnic control thermostats are designed for panel or bracket mounting in a central boiler plant room in a commercial or public building.

They are intended to measure and help control the temperature in calorifiers, hot water cylinders and other similar appliances by measuring the surface temperature or on adjacent pipework.
When the switching temperature has been reached the thermostat breaks the electrical circuit causing a motorised control valve to close and isolate the primary hot water supply to the appliance.
When the temperature in the vessel falls below the set temperature less the temperature differential $\Delta T$ the thermostat switches, closes the electrical circuit and the motorised control valve opens.
The thermostats require four $\mathrm{M} 4 \times 6$ long screws to mount the thermostat and control knob bezel to the panel or bracket - not supplied.
A range of control knobs are available to match the operating range of thermostats but are not included as part of the thermostat and must be ordered separately.
